The agency's approval came three years after e-cigarettes first reached the market. The e-cigarette industry is applauding the agency's new position, and claiming that the new regulation will put the products in the hands of millions of people who had been turned away by conventional cigarettes. In 2014, the FDA approved the industry's first electronic cigarette product. Last month, the agency approved the JUUL. The new approval requires that the FDA create a timeline for research into the long-term health effects of e-cigarettes. Toy Robot The Toy Robot was an experimental robotic system developed by Robert Dudley in the 1960s for explorations in the interface between computers and the real world. The toy robot was used to develop the first commercially successful computerized home companion, TRS-80's Pimsleur. Rationale The original goals of the Toy Robot were to investigate ways that human emotions could be reproduced by computers and to simulate human perception. While both of these things could be accomplished, the Toy Robot was actually a failure as a robotics development tool. The challenge of making a robot that is both interactive and does interesting things that excite children was too great. Most of the Toy Robot is in the National Museum of American History. It was displayed on October 2, 2001, to commemorate the 20th anniversary of the museum. The Toy Robot was put on display on the second floor of the museum, adjacent to the National Robotics Hall of Fame. Origin Dudley and his wife, Jean, received a US government grant to build the first 'computer controlled toy' for children. They met with Joseph B. Coyle, an electrical engineer at the RCA Research Laboratory, to work out details

Q: Initialize collections I am trying to understand why I need to initialize a collection in the following manner: var builder = new ExpressionBuilder(); // sets field1 = user builder.Setter = new Setter("Field1", user); // sets field2 = db builder.Setter = new Setter("Field2", db); // sets field3 = null builder.Setter = new Setter("Field3", null); I understand that builder.Setter.Value = value; will assign the value to the collection, but it is only after I have set the collection that I set the value of the collection - does this mean that in some cases when the collection is set to null (not initialized), it is equal to the variable of the collection (which makes sense) or the actual collection is NOT initialized and can be changed without changing the variable of the collection? Also, why can I not do the following: builder.Setter = new Setter("Field3", null); A: You can always set a collection using a FieldValue, whether it's a built in value type or not. But there's no way to tell if it's null or
